Abstract (en)
[origin: WO2017036516A1] A system and method are disclosed for extracting personal information from daily vocal dialogues for people wearing augmented reality glass. Designed to help people with impaired memory (like Amnesia, Alzheimer's disease, etc.), the system is able to automatically extract practical personal information from daily face-to-face conversation. Those information will be stored as private dataset for later searching and inquiring in related applications such as reminding and recommendation systems.
