Abstract (en)
[origin: WO2016078776A1] A device (10) for optically controlling a face (13) of a blank (12), comprises a vacuum conveyor (20) capable of transporting the blank (12) along a path of travel (15) and comprising a conveyor belt (22) having an apertured structure of which the conveying path follows the path of travel (15) of the blank (12), and suction means (40) that are suitable for pressing the blank (12) against the conveyor belt (14), and inspection means (30) for inspecting the face (13) of the blank (12) during the transportation of same by the vacuum conveyor (20), located on the side opposite the vacuum conveyor (20). The suction means (40) delimit three separate successive suction sections (41, 42, 43) along the path of travel (15), including a central suction section (42) that extends opposite the inspection means (30), an upstream suction section (41) and a downstream suction section (43).
