Abstract (en)

[origin: US2017241625A1] A lighting device for an automotive vehicle includes a printed circuit board having one or more electronic components, and a support joined, or capable of being joined, to the printed circuit board. The lighting device included a first joining device for joining the printed circuit board to the support, the first device permitting the printed circuit board to rotate, with respect to the support, about an axis and perpendicularly to the axis. Also included is second joining device for joining the printed circuit board to the support, located at a distance from the first joining device and capable of blocking the rotations of the printed circuit board with respect to the support, in an assembled configuration of the printed circuit board and the support.
