Abstract (en)  
[origin: WO2016045798A1] The invention relates to a dialysis machine having an extra-corporeal blood circuit, a blood pump, a dialyser, a venous pressure sensor, a substitute line and a control unit, wherein the control unit is designed to operate the blood pump in a first operating mode and in a special operating mode, and to start the special operating mode after recognising a trigger event, in which special operating mode a pump rate of the blood pump is controlled based on a target or regulated to a desired value, which target or desired value is deduced from or corresponds to a value that is determined before the current special operating mode is started, wherein a scan for the presence of at least one impediment is carried out before the special operating mode is started, and in the event that there is an impediment, the starting of the special operating mode is blocked or delayed, and/or the selection of the target or of the desired value in the event of an impediment differs from the selection thereof when there is no impediment.
