Abstract (en)
[origin: WO2016198190A1] The invention relates to a sheet-processing machine having a deliverer and having a sheet conveying system which transports sheets (7) to a delivery stack (9) and with a respective sheet leading-edge of the sheets (7) onto at least two leading-edge stops (12), wherein the at least two leading-edge stops (12) define a leading-edge stop plane (12.2), wherein at least one further stop (16, 14) is provided for aligning the delivery stack (9) on a further edge of the delivery stack (9), and wherein at least one detecting unit (24, 29) is configured for monitoring at least one point (25.4, 26.4, 30.4) which is positioned downstream of the leading-edge stop plane (12.2) in the sheet transport direction (39), and having a sheet delivery system for delivering sheets over a delivery stack, and to a method for depositing sheets. The invention is based on the object of providing a deliverer of a sheet-processing machine. In particular, the deliverer is configured in such a way that damage as a result of sheets which are deposited in a faulty manner can be ruled out and the effectiveness of the machine is increased. According to the invention, the object is achieved by virtue of the fact that at least one sensor (17, 15) is configured for monitoring at least one further point (17.2, 15.2) which is positioned upstream of the leading-edge stop plane (12.2) in the sheet transport direction (39).
