Abstract (en)
[origin: WO2016083215A1] The invention relates to a railing bar (24) and to a scaffolding (10) having a railing bar (24). At each of the ends of the railing bar in the longitudinal direction (38), the railing bar (24) has a coupling region (40, 42), and each coupling region has a gate (50, 52). Both gates (50, 52) have a first and a second gate segment (58, 60, 62, 64), the longitudinal axes (74, 76) of which extend like the legs of the letter V and are preferably symmetrical with respect to the longitudinal axis (38) of the railing bar (24). The two gate segments (58, 60, 62, 64) are preferably connected by a third gate segment (66, 68), which is perpendicular to the longitudinal axis (38) of the railing bar (24). In the direction of the longitudinal axis (38) of the railing bar (24), the third gate segment (66, 68) is preferably connected to a passage opening (54, 56) by means of a fourth gate segment (70, 72). Preferably, a mushroom-shaped scaffolding pin (22, 26) can be moved in a translational manner in each gate (50, 52).
