Abstract (en)
[origin: WO2016084015A1] The connector (10) comprises a male part (12) having a first electrical contact element (16) arranged to be mechanically and electrically connected to a first conductor length, and a female part (14) having a second electrical contact element (18) arranged to be mechanically and electrically connected to a second conductor length. The female part (14) has a seat (78) which extends along an axial direction (x) and is arranged to receive the male part (12) in a connection position such that the first electrical contact element (16) is in contact with the second electrical contact element (18). The female part (14) further comprises a first tubular body (72) of electrically conductive material which is electrically connected to the second electrical contact element (18) and extends around the seat (78), coaxially thereto, for such a length that in the connection position the male part (12) is wholly located inside the volume enclosed by the first tubular body (72).
