Abstract (en)
[origin: WO2016087526A1] The invention relates to a system for adjusting the height of an agricultural implement (O), comprising: an arm (1) that can be controlled so as to raise and lower the implement; a height measuring sensor (E, R) mounted on the arm and positioned in front of the implement in the direction of travel of the vehicle equipped with the arm; and a computer configured to provide a control set point for the height of the arm on the basis of the measurements obtained by the sensor, characterised in that the sensor is a light screen device formed by an emitter (E) in the form of a column of light sources (S1, S2, Sm) and a receiver (R) in the form of a column of light receivers, the emitter and the receiver being mounted on the arm facing one another and extending along the longitudinal axis thereof, perpendicularly to the ground, in order to measure the height of plants located therebetween.
