Abstract (en)
[origin: WO2016089834A1] A portable power tool system, in particular a router system, includes a router and a depth adjustment device for adjusting a plunge depth of the router into a workpiece. A base defines a platform configured to be supported on the workpiece, a stop element, and a support structure. The router is received in a carriage slidably mounted on the support structure relative to the platform. The depth adjustment mechanism engages the stop element as the carriage slides toward the platform to define a plunge depth of the router, and is selectably mountable in a first position, whereat the depth adjustment mechanism is operable to adjust the plunge depth according to a first measurement scale, and a second position, whereat the depth adjustment mechanism is operable to adjust the plunge depth according to a second measurement scale different from the first.
