Abstract (en)
[origin: WO2016087325A1] The present invention regards an anti-refill pourer, to be applied on the neck of a bottle, of the type comprising a hollow cylindrical body (2) equipped on its lower base (3) with a hole and closed on top by a cap (5) equipped with a dosing spout (6), with suitable openings (7) and with a lid. The hollow cylindrical body encloses a ball (9) floating between the hole and the lid. Such an anti-refill pourer (1) has the body (2) with an outer diameter of dimensions such as to require a pressure insertion in the mouth in the neck of the bottle, of a thickness such as to make it rigid. According to the finding it is in particular foreseen that in the cap (5) there is an embossed outer ring, which clings to the body (1) and is connected to the collar of the dosing spout (6) through an inclined circular wall. Moreover, said lid is supported through inclined radial ribs, projecting from the base of the aforementioned collar.
