Abstract (en)  
[origin: CN107005871A] A content presentation system in which a set of content items, which may include static stored content documents and/or live content streaming from computing devices, is provided by a web channel engine to a web channel. A rules engine (e.g., of a web channel server or a web channel presenter) is configured to sequentially present some of the contents to a user in a video form in an automated way, based on real-time sensor data of user devices and/or interactions of the users with the web channel, including users who are provided with permissions to edit the content, look and feel of the web channel, and users who watch the web channel without editing privileges.
