Abstract (en)

Machine for testing thermal resistance of plastic materials, comprising a tank (2) configured, in use, to be filled for example with a heat-transfer fluid; a heating coil (11) for heating the heat-transfer fluid; a temperature sensor (13) generating a temperature signal (T) of the heat-transfer fluid; and a control unit (4) calculating a degradation index (N) of the heat-transfer fluid on the basis of the temperature signal. In particular, the degradation index is calculated by determining (54) the temperature range associated with the temperature signal (T), updating (58) the corresponding partial heating time, and calculating (62) the weighted sum of the partial heating times previously saved in memory and pertaining to different temperature ranges. Upon reaching one or more thresholds, signals are generated which indicate the need to replace the heat-transfer fluid.
