Abstract (en)

[origin: WO2016091390A1] The invention relates to a method and an apparatus for sorting transport containers having items of value, in particular for sorting safe bags. Arranged along the movement path of the transport containers is a metal detector for checking each of the transport containers moved along the movement path for the presence of foreign metal bodies. Arranged downstream of the metal detector is a diverter at which the movement path splits into at least two branches. A control device controls the diverter depending on whether the particular transport container contains foreign metal bodies, specifically such that, if the particular transport container does not contain any foreign metal bodies, it is directed into a first of the branches, and if it contains one or more foreign metal bodies, it is directed into a second of the branches.
