Abstract (en)

[origin: WO2016096098A1] The invention relates to a conveyor device for a molten metal in an injection pressure unit, for example a cast metal machine, comprising a storage tank for the molten metal and a conveyor channel in which the molten metal is guided to a mould cavity. Said conveyor channel comprises a cylinder bore in which a piston having a maximum stroke, which is defined between a first position and a second position, is arranged so it can be axially adjusted. A collecting chamber for the molten metal is provided in the cylinder bore, from which the molten metal can be introduced into the mould cavity through a transporting line, following an axial displacement of the piston. An adjusting device, which can adjust the maximum stroke of the piston, is provided.
