Abstract (en)

[origin: WO2016097551A1] The invention relates to a method for diagnosing an energy-transfer management device, comprising a first terminal, a second terminal, a third terminal intended for being connected to at least one electricity consumer, and a fourth terminal intended for being connected to an electric-energy storage system, said device comprising a first main switch connected to the second terminal as well as to the third terminal, and a second main switch connected to the fourth terminal as well as to the third terminal, the method including the following steps: initialising a position of the switches, testing the second main switch, opening the second main switch, requesting the closing of a switch inside the storage device, testing the first main switch according to a measurement of the voltage at the terminals of the storage device, and testing the first main switch based on a current measurement.
