Abstract (en)
[origin: WO2016097616A1] The invention relates to a fluid-product vessel comprising a bottom (11) and a sliding cylinder (47), a piston (6) being mounted so as to slide tightly inside the sliding cylinder (47), resilient biasing means (5) being provided so as to push the piston (6) in the sliding cylinder (47) so as to reduce the useful volume (V) of the fluid-product vessel, the vessel comprising holding means (44, 45, 62) for retaining the piston (6) in an initial position against the resilient biasing means (5) such that the fluid product stored in the vessel is not subjected to the pressure of the piston (6) pushed by the resilient biasing means (5), the fluid-product vessel also comprising an unblocking member (3) for deactivating the holding means (44, 45, 62) such that the resilient biasing means (5) push the piston (6) which exerts a pressure on the fluid product stored in the vessel, said unblocking member (3) being movable between an inoperative initial position and an operative final position in which it acts on the supporting means (44, 45, 62) in order to deactivate same, characterised in that the unblocking member (3) is accessible, for moving same from the inoperative initial position to the operative final position, through an access opening (13) formed at the bottom (11) of the fluid-product vessel.
