Abstract (en)

[origin: WO2016096087A1] The invention relates to an operator control device (10) for a vehicle, in particular a passenger car, comprising a base element (12), at least one switching element (14), which can be moved from a first position into at least a second position in relation to the base element (12), at least one electrical contact thus being closed, at least one button (22), which can be moved in a movement direction (20) between an idle position and at least one actuation position in relation to the base element (12) and by means of which the switching element (14) can be moved from the first position into the second position by movement of the button (22) from the idle position into the actuation position, and at least one restoring element (24), which is supported on the base element (12) and on the button (22) and can be elastically deformed by movement of the button (22) from the idle position into the actuation position and by means of which the button (22) can be moved from the actuation position into the idle position as the restoring element (24) is at least partially relaxed, wherein the restoring element (24) is formed of silicone.
