Abstract (en)

[origin: WO2016102349A1] The invention describes a roll-removal device by means of which a plurality of rolls which have been wound to completion are transported away from a winding shaft, * having a displacement device for displacing the rolls relative to the winding shaft, in order to withdraw the rolls from the winding shaft, * having a receiving device for receiving the rolls, and * having a transfer device for transferring the rolls from the displacement device to the receiving device, wherein the rolls can be rolled freely at least in certain regions, the rolls rolling about their rolling axes. By means of this device for changing the position of the roll axes, the roll axes of two adjacent rolls can be moved to an angle of less than 180 degrees in relation to one another.
