Abstract (en)
The present invention relates to a fire resistant construction panel system (1), comprising at least a first and a second panel element (9a, 9b). Each panel element comprises a first face sheet (10a, 10b) and a second face sheet (11a, 11b), adapted to lend stability to the construction panel. The panel element further comprises an insulating core layer (12a, 12b) arranged between the first and the second face sheet. The first face sheet, the second face sheet and the core layer together form a sandwich-type construction panel, and at least one of the first and the second face sheet consists of a fireproof material. The construction panel system further comprises a connector element (16), adapted to be received in corresponding at least one groove (24). The groove is arranged in a longitudinal direction along a rim of the respective core layers. The connector element, when provided in the groove, joins the panel elements together. The connector element is made from a fire resistant material. The invention further relates to a method of forming a wall using the system.
