Abstract (en)  
An illumination device comprises a LED light source assembly (1) including a plurality of LED light sources (11), and an optical assembly (2) including at least one optical element (21) which is connected to the LED light source assembly (1) for shaping the intensity distribution of the light emitted from the plurality of LED light sources (11). A means is provided for generating at least a first light intensity distribution pattern and a second light intensity distribution pattern with the same LED light source assembly (1) and the same optical assembly (2).
