Abstract (en)

[origin: WO2016139047A1] The invention relates to a device (2; 102; 202; 302) for detecting a cold movement of a rail vehicle (1) having a display device (110; 210; 310) and having an activation device (130; 230; 330) for activating the display device. The device (2; 102; 202; 302) is made particularly robust and resilient by means of an apparatus (140; 240; 340) for forming a mechanically operative connection of the display device (110; 210; 310) to a vehicle part (3) which can be moved as a function of the cold movement of the rail vehicle. By means of this apparatus (140; 240; 340), the activated display device (110, 210; 310), is, on the one hand, kept, in an active status when the vehicle part (3) is stationary and, on the other hand, in the event of a predefined change in position of the vehicle part (3) said activated display device (110, 210; 310) is subjected to a change in status from the active status to a passive status. The invention also relates to a rail vehicle comprising such a device. Furthermore, the invention relates to a method for detecting a cold movement of a rail vehicle.
