Abstract (en)

[origin: WO2016116791A1] The process allows to form a pack of several containers and consists of wrapping the assembly of the containers, arranged in an orderly way, by a sheet made from a heat-sealable plastic material, at least two of the opposite edges of the sheet being superimposed and heat-sealed to each other to obtain a pack whose envelope features a substantially parallelepiped shape. Before wrapping said sheet around the assembly of the containers to obtain the pack, at least a part of those surface areas of the sheet which are destined to get in contact with the containers is at least partially coated with a substance that prevents each of said containers from slipping with respect to the envelope of the pack.
