Abstract (en)

[origin: WO2016116526A1] A door drive (10) mounted on or in a door of a building comprising a door panel (F) mounted, preferably in door hinges (B), in a stationary frame (R) and pivotable about a vertical door axis, comprising a main drive (1) and an auxiliary drive (2). According to the invention, the auxiliary drive (2) has one or multiple components mounted on the frame side (R) – subsequently called frame-side mounted component device of auxiliary drive (2) – which are mounted on the frame side (R) in such a way that a mounting space (M) remains open and/or is formed which is specified for the mounting of at least one or multiple additional function components of the main drive, which interact with the slider (1kag) and/or the slide arm (1ka) of the main drive (1) and which are to be mounted on the frame side – subsequently called additional function component device of the main drive (1).
