Abstract (en)  
The present invention relates to an electrical connector (100) comprising a connector housing (110), a mate assist lever (200) arranged movably on the connector housing (110) to facilitate the mating process with a corresponding counter connector and a locking device (300) mounted movably on said lever (200), wherein the locking device (300) can be arranged in two positions, a deactivated position wherein movement of said lever (200) is prevented and an activated position, which allows movement of said lever (200) characterized in that said lever (200) is arranged on the housing (110), such that in a first position the mating process of the connector (100) with the corresponding counter connector can be initiated and wherein in said first position movement of said lever (200) can be prevented by arranging the locking device (300) in its deactivated position.
