Abstract (en)

[origin: WO2016120610A1] The present invention provides for a garment having a front section (3) and a back section (1) and means (4) for releasable attachment of regions of the front section to regions of the back section, the garment being arranged such that, with the attachment means released, the front section can be located to allow a wearer to be positioned adjacent the back section, and further arranged such that the front section can be placed adjacent the front of the wearer when the wearer is so positioned adjacent the back portion, and attached to the back section by the attachment means, and in this manner the front and back sections can serve to define a garment fitting around at least one or more of the torso, waist and limbs of a wearer, in a manner such that the wearer is "dressed" by having the front and back sections attached while enclosing at least a portion of the wearer's body, and wherein the attachment means can comprise magnetic means, can also include a degree of flexibility and, if for the upper body, the garment can also include sleeve portions for the insertion of a wearer's arms.
