Abstract (en)
A drainage element for use in a drainage system for a sloping perimeter of a pitched roof. The drainage element includes: an opening for receiving a roof covering element at a roof-facing side of the drainage element; a side wall for guarding against ingress of water beneath the roof covering element at an outward-facing side of the drainage element opposite the roof-facing side; and a base wall that extends laterally between the roof-facing and outward-facing sides of the drainage element and longitudinally between leading and trailing edges of the drainage element. The base wall defines an internal drainage surface for draining precipitation internally within the drainage element in a longitudinal direction towards the leading edge. The base wall further defines an external-facing surface opposite the internal drainage surface, the base wall being provided with a flow-directing means configured to direct water flowing longitudinally along the external-facing surface of the base wall in a lateral direction towards the outward-facing side of the drainage element.
