Abstract (en)

[origin: EP3253180A1] A controller (102) is configured to control lighting devices (300) via a network using multiple pieces of identification information to cause a first lighting device and a second lighting device among the lighting devices (300) to be turned on at a first emission intensity in a first period, and the first lighting device to be turned on at a second emission intensity different from the first emission intensity and the second lighting device to be turned on at the first emission intensity in a second period, the first period and the second period being consecutive. An acquirer (103) is configured to acquire a first captured image generated in the first period and a second captured image generated in the second period. An identifier (104) is configured to identify an installation position of the first lighting device in a space based on the first captured image and the second captured image.
