Abstract (en)

[origin: WO2016124881A1] A drinks pouch comprising an internal cavity suitable for containing a drink, the cavity being defined by one or more wall which encloses the cavity. At least part of the wall is constructed from a heat bondable pliant packaging material such as a laminate which is shaped and sealed to form a pouch. A drinking straw is sealed within the cavity in a channel which is formed by heat bonding together parts of the pliant packaging. An openable section for opening the drinks pouch is located near the channel, which when opened creates a hole which allows access to the drink in the cavity. The channel is positioned to guide the straw through the hole when the pouch has been opened.
