Abstract (en)
[origin: WO2016124373A1] The invention relates to an arrangement (100) which has the following: a first component (110) and a second component (120), at least the first or second component (110, 120) being a fiber/plastic composite component; and a securing means (130) which generates a pressing force that presses the components against each other such that the components (110, 120) are secured to each other in a clamped manner; wherein a friction coefficient-increasing means (150) is arranged between the first and the second component (110, 120) in a pressing region in which the first component and the second component are pressed against each other by the pressing force, said means increasing a stiction produced for the pressing force in contrast to a case in which the means (150) is not arranged in the pressing region.
