Abstract (en)
Accordingly, one aspect of such an improved technology involves a method of controlling an elevator installation (1) in a building (2). The elevator installation (1) includes a drive system (14), an elevator car (10) coupled to the drive system (14) and is movable between floors (L1, L2, L3) of the building (2) to transport a passenger (28) from a boarding floor to a destination floor, a floor terminal (5) on a floor (L1, L2, L3) served by the elevator car (10), and an elevator controller (12) communicatively coupled to the drive system (14) and each operating panel (5). The elevator controller (12) receives call input information indicating a destination floor to which the passenger (28) wishes to be transported, and controls the drive system (14) to move the elevator car (10) with the passenger (28) on board to the destination floor in response to the call input information. Further, the elevator controller (12) controls an indicator (4) at the destination floor to indicate approach of the elevator car (10) at the destination floor.
