Abstract (en)
[origin: WO2016128313A1] The present invention relates to a method for operating a lift system comprising a car which is moved in a lift shaft, wherein the car stops at a floor, wherein the car comes to a standstill at the floor and the flow of energy is interrupted and/or the service brake is activated in the process, wherein, in the case of the flow of energy being interrupted, a flow of energy of a drive of the car is interrupted, and wherein, in the case of the service brake being activated, a service brake is activated, and wherein, if necessary, a position of the car is adjusted at the floor, wherein the position of the car in the lift shaft is adapted relative to the floor during the adjustment, wherein at least one operating parameter which relates to a change in loading of the car is detected (202) and it is determined whether there is a need for adjustment (203) at the floor, depending on the at least one operating parameter at least before the car comes to a standstill.
