Abstract (en)

The screening arrangement comprises a bottom element (4) and two side rails (10). The bottom element (4) is movable with respect to the two side rails (10) between a non-screening position and a screening position by means of a drive means comprising a first transmission means (30) arranged in the bottom element (4), and a second transmission means (20) arranged in each of the two side rails (10) such as to extend substantially in the longitudinal direction of the side rail (10). Each side rail (10) comprises a first flange (11) extending substantially in the width direction (W), a second flange (12) extending substantially in parallel with the first flange (11), in the width direction (W), and positioned to cover at least a part of the bottom element (4), and a third flange (13) connecting the first and second flanges (11, 12) and extending substantially in the depth direction (D). The second transmission means (20) is formed integrally in at least one of said flanges (11, 12, 13) of said side rail (10), and that said side rail (10) is of an extrudable material.
