Abstract (en)  
A variable geometry assembly for modulating a fluid flow in a turbomachine is disclosed. The assembly comprises: a first ring (33; 133) having a plurality of first wedge-shaped elements (37; 137) and having an axis (A-A); a second ring (35; 135) having a plurality of second wedge-shaped elements (39; 139) and having an axis (A-A). The second ring is substantially coaxial to the first ring. The second wedge-shaped elements (39; 139) co-act with the first wedge-shaped elements (37; 137). Flow passages (41) are defined between pairs of sequentially arranged first wedge-shaped elements (37; 137) and second wedge-shaped elements (39; 139). The first ring (33; 133) and the second ring (35; 135) are angularly displaceable one with respect to the other. Moreover, the first ring (33; 133) and the second ring (35; 135) are configured to move axially with respect to one another when the first ring and the second ring are angularly displaced one with respect to the other.
