Abstract (en)  
[origin: EP3258166A1] To use a simple structure to achieve light emission of different colors in vehicular lighting producing light emission in a manner such that light of a light source including a semiconductor device is guided into a light guide member. The vehicular lighting includes an inner one-color light source 90 and an outer other-color light source 101 which include semiconductors. The vehicular lighting includes an upper light guide member 111 guiding light from one end toward the other end, the light being launched from the inner one-color light source 90 and the outer other-color light source 101 to an inner entrance 112 and an outer entrance 114 at the one end, the inner and outer entrances 112 and 114 being located at one end. The inner one-color light source 90 and the outer other-color light source 101 enabling launch of respectively different color lights are mounted at both ends of the upper light guide member 111.
