Abstract (en)  
[origin: WO2016132348A1] A heavy-duty, thermoplastic storage bin comprises a rectilinear base, spaced columns integrally formed with the base, and rectangular end and side panels that are foldable and erectable with respect to the base. At least one of the panels is detachable from the base. At least one central column having an integral portion protrudes upwardly from an upper base surface and is interlockable with a corresponding side panel at a bottom center region, for generating a sufficiently high sagging resisting moment. In a method for emptying the bin, the base is supported by a forklift, after the bin has been loaded with desired products. Following a material handling operation by the forklift, a tilting device carried by the forklift is operated to sufficiently change a disposition of the bin such that the loaded products are caused to be emptied while a side panel remains engaged with the central and corner columns.
