Abstract (en)

[origin: EP3260354A1] An object of the present invention is to provide an electric power steering apparatus that achieves a desired steering characteristic in minutely steering at on-center, suppresses frictional feeling, and improves linear steering feeling at on-center, and a control apparatus that determines a parameter. [Means for solving the problem] An electric power steering apparatus that calculates a current command value by using an assist map related to a steering torque and a vehicle speed, drives a motor based on the current command value, and assists and controls a steering system comprising a torsion bar in a column shaft, comprises a function of detecting steering angle information, and a SAT compensating-cum-virtual spring compensating section that calculates a SAT compensation-cum-virtual spring torque corresponding to the steering angle information based on the steering angle information and the vehicle speed and outputs a compensation signal to which the SAT compensation-cum-virtual spring torque is converted in accordance with a current conversion coefficient, compensates the current command value in accordance with the compensation signal, and gets a desired characteristic of on-center feeling.
