Abstract (en)  
[origin: WO2016134799A1] The invention relates to a device for controlling the movement of a furniture part (2) which is movably mounted on a furniture carcass (1), the device comprising guide means (4) acting between the furniture carcass (1) and the furniture part (2) and by means of which the furniture part (2) can be moved from a closed state relative to the furniture carcass (1), in which the piece of furniture assumes a position in which it can be moved toward a front face of the piece of furniture, to an open state of the furniture part (2) relative to the furniture carcass (1) and back to the closed state. According to the invention, the guide means (4) are designed to move the furniture part (2), during an opening process, out of the closed state such that, in a first movement phase of the opening process, a horizontal distance between the furniture part (2) and the front face of the furniture carcass (1) increases, and in a second movement phase of the opening process, the furniture part (2) is swiveled about an axis (15) by way of a single-axis swiveling movement.
