Abstract (en)
[origin: WO2016134766A1] The invention relates to a measuring device (100), comprising at least one sensor (111, 112, 113), at least one processor (120), at least one memory (130), and at least one output interface (140), wherein at least first the processor (120) and the memory (130), second the sensor (111, 112, 113) and the memory (130) or the sensor (111, 112, 113) and the processor (120), and third at least the output interface (140) and the memory (130) or the output interface (140) and the processor (120) are in signal communication with each other, wherein device-specific data (150) and/or application-specific data (160) are stored at least in one region of the memory (130), wherein the processor (120) is designed to perform a calculation of the measured-value deviation (4) on the basis of the device-specific data (150), the application-specific data (160), and the measurement data (1, 2, 3) measured by the sensor (111, 112, 113) and wherein the calculated measured-value deviation (4) can be output by means of the output interface (140).
