Abstract (en)  
[origin: WO2017198728A1] A contacting device (1) comprises a housing (3), in which a first contact element (4) is disposed. The first contact element (4) comprises a receiving space (30) for a second contact element (7), said space being open to at least one opening (15, 23, 15', 23') of the housing (3). The first contact element (4) can be displaced transversely to a central longitudinal axis (31) of the receiving space (30) relative to the housing (3) against a spring element (5), so that the second contact element (7) can be inserted into the receiving space (20) and clamped in the receiving space (30) by means of the spring element (5). The first contact element (4) is fixedly connected to at least one plug-in contact element (6). A transmission of electrical energy from a power supply line (44) to a circuit board (8) can thus be achieved simply and reliably.
