Abstract (en)

[origin: WO2016141913A1] The invention relates to an acoustic transducer for receiving waterborne sound shock waves, wherein the acoustic transducer comprises an acoustic piezoelectric patch transducer element having a ceramic filament or a plurality of ceramic filaments and comprises a filling compound, wherein the ceramic filament or the ceramic filaments is or are surrounded by the filling compound. A first pressure plate is arranged before the acoustic piezoelectric patch transducer element in a sound shock direction, such that an impinging sound shock from the pressure plate is imposed on the ceramic filament or the ceramic filaments, such that the sensitivity of the acoustic transducer is increased. The invention further relates to an acoustic transducer device, to a sonar for receiving waterborne sound shock waves, and to a water craft, in particular a submarine.
