Abstract (en)

[origin: WO2016144838A1] The present disclosure describes methods for classifying two or more different populations, such as Alzheimer's disease. The disclosed method(s) utilizes a novel two-stage analysis for enhancing separation, e.g., biomarkers associated with Alzheimer's disease patients from age-matched controls and non-Alzheimer's disease demented patients. The analysis accounts for the linear dependence of output variables on input variables that are altered by, e.g., variables such as fetal bovine serum, age of the patients, and/or protein concentration.
