Abstract (en)

The invention relates to a device for supporting a load of a gangway structure between two cars, the device having a beam, on which the load of the gangway structure can be supported, and two sliding means which are supported by the beam; each of the sliding means having at least one connecting structure to be connected to one of the cars; the beam and the sliding means are adapted such that the sliding means are compulsorily coupled to the beam to move in opposite directions at least substantially the same distance relative to the beam in a translational direction along the longitudinal axis of the beam.
