Abstract (en)
[origin: WO2016142441A2] A method is provided of manufacturing a wrapped object, comprising a first segment and a second segment connected to each other by a curved transition segment having a common tangent with the first segment and a common tangent with the second segment, respectively. The method comprises the step of providing a mandrel with a surface structure to define at least part of the shape of the first segment, of the shape of the second segment and of the shape of the transition segment in between, and the step of wrapping, one or more elongate elements over the mandrel and bonding the one or more elongate elements to itself and/or each other so as to provide the first segment, the second segment and the transition segment as a continuous structure. The mandrel is provided with a fortification at least at the position of the transition segment, the fortification being configured to support the one or more elongate elements forming the transition segment against inward-directed forces, with respect to the direction of curvature of the transition segment, while wrapping and/or bonding the one or more elongate elements to form the transition segment.
