Abstract (en)

[origin: WO2016146231A1] The invention relates to a valve assembly for an antilock system of a brake system of a vehicle, comprising a cylindrical rotary slide (2), which is rotatably supported in a valve block (1), can be actuated by a stepper motor, can assume at least two switching positions, and has an inlet (8) and an outlet (9), in the case of which rotary slide a pressure medium can be admitted via the inlet (8) into at least one channel (15) leading to a wheel brake cylinder in one of the switching positions, and in the case of which rotary slide the pressure medium can be led away via the outlet (9) in another of the switching positions. In the case of said valve assembly, the inlet (8) and the outlet (9) of the rotary slide (2), according to the invention, are arranged in different axial planes and at an angular offset from each other.
