Abstract (en)

[origin: WO2016146244A1] A key safe (1) to be attached to a mounting surface has a wall element (4), which can be fixed on the mounting surface and onto which at least one key can be fastened, a housing part (13), by means of which the wall element (4) and optionally the at least one key can be covered, and a combination lock (2), by means of which the wall element (4) and the housing part (13) can be locked to one another when the key safe (1) is closed. In order to make a key safe (1) of this type more mechanically stable and actuatable in a more simple way with a comparatively low technical and constructive effort, it is proposed in the present invention that the housing part (13) is configured to be round on its edge (14) allocated to the wall element (4), that the housing part (13) can be rotated relative to the wall element (4) when the key code is set on the combination lock (2), and that the housing part (13) can be removed from the wall element (4) after a rotation about a predeterminable angle of rotation relative to the wall element (4).
