Abstract (en)

[origin: WO2017116363A1] The invention relates to a heat insulation module (1) placed between the main structure floor (7) and a balcony (6) or a similar construction component extending from the floor (7), and thus allows separation of the balcony (6) and the floor (7) from each other without contacting each other and ensures continuity of the insulation (8) at the facade (5) during rough construction in the construction sector. The invention is characterized in that; it comprises light concrete blocks (3) providing the connection between said balcony (6) and floor (7) by means of the tension reinforcements (4) passing through thereof, and providing both the heat insulation and the transfer of tensile and pressure forces via its body, at least one insulation block (2) placed among said light concrete blocks (3).
