Abstract (en)

[origin: WO2016147207A1] An indicator assembly (1) for ordinary and extraordinary maintenance of panic handles and bars (2). The handles and bars (2) comprise a frame (9), which is integral with the installation leaf (3), for supporting an actuation device (10) that controls a closure element (5). The assembly (1) comprises at least one sensor (12) for detecting the configuration of the actuation elements (10), the sensor (12) being controlled by a control and management unit provided with at least one memory element for storing the number of events that correspond to a configuration change. The control and management unit is connected to an indicator (11), which can be activated upon reaching a preset number of configuration transitions. The actuation elements (10) have an active configuration, which corresponds to the retraction of the element (5), and a passive configuration, which corresponds to the element (5) extracted for closure.
