Abstract (en)

[origin: WO2016147124A1] An electronic device for driving a lock (100), comprises a support (2) for connection with the cylinder (104) of an existing lock having at least one through opening (3) for receiving a projecting portion (107) of the cylinder (104) and fastening means (4) to block the support (2) with respect to the projecting portion, and a gear motor (6) provided with an actuator (7) and a transmission (8) configured for rotating the cylinder (104) and allowing the opening or closing of the lock (100), in which the actuator (7) is defined by an electric motor (7a) having axis of rotation (B) parallel and offset with a central axis (a) of the opening (3) so as to be parallel to the cylinder (104).
