Abstract (en)
[origin: WO2016146218A1] The invention relates to a door hinge (1) or window hinge (1) having two hinge parts (3, 4) which are operatively connected to one another so as to be rotatable about a common hinge axis (2), wherein at least one door- or window-side first hinge part (3) has a plate-like portion (8) which interacts in a fixedly and releasably connectable manner with a holding piece (9) which can be inserted into a groove in the end side of the door or window, wherein the plate-like portion (8) is oriented in an imaginary plane running parallel to the hinge axis (2) and is adjustable with respect to the holding piece (9) in an imaginary plane running at a right angle to the plane of the plate-like portion (8), and wherein an adjustment screw (11) can be screwed into at least one thread (10) of the holding piece (9). Provision is made for a head (12) of the adjustment screw (11) to be arranged between an intermediate piece (14) and the plate-like portion (8) by means of a clamping device (5) which applies force to the plate-like portion (8) and the intermediate piece from opposite sides and thus holds them together.
