Abstract (en)  
[origin: WO2016146743A1] A shut-off valve assembly for use on a cylinder containing pressurised fluid. The shut-off valve assembly comprises a valve element movable between an open position and a closed position in response to rotation of a lever from a first position to a second position. The lever is biased towards the second position by a biasing means and the valve assembly comprises a securing means for locking the lever in the first, or open, position. The securing means can release the lever to allow the valve element to return to the closed position by the biasing means.
